

D.4 CAROLINA CLIPPER

The Carolina Clipper (“C-Clip”) is designed to provide a fast, easy, and secure method of interconnecting PolySteel Forms without the use of foam adhesives. This innovative product greatly reduces time it takes to secure forms together by installing faster and eliminating the curing time required for adhesives. It also can be removed, if necessary, to allow for changes and/or adjustments during installation.

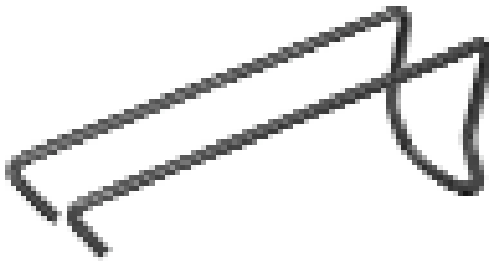

D.4.1 APPLICATIONS.

There are a variety of uses for the C-Clip that can aid in the speedy installation of your PolySteel project:

- ✓ Wet or dry setting multiple forms at one time by clipping forms together end-to-end.
- ✓ Consolidating forms together for ease and safety in transportation.
- ✓ Panelizing PolySteel wall sections (See Section D.11).

D.4.2 INSTALLATION.

As shown below, the C-Clip hooks over the welded wire tie in one form and snaps securely over the tie in the adjoining form to create a solid stable unit. This method applies to connecting forms end-to-end or top-to-bottom. If the fit between forms is too loose, simply spread the legs of the clip to shorten its overall length and the forms will hold securely together. All forms must be placed in the same direction end-to-end.
